

Global Remote Monitoring & Diagnostics

LearyNET™

The **LearyNET™** iQ module is a remote access tool for operator assistance. **LearyNET™** remote assist enables Leary technical support personnel to securely log in to your connected Leary Array™ system. This connection will allow for remote technical support, job set-up assistance and system updates. **LearyNET™** remote access saves you time and money by reducing downtime and the requirement for on-site technical support.

Leary's iQ™ Cloud-Based Smart Service can also retrieve data from the production line where your SecureSCAN™ controller is installed. Because the data is automatically collected, the risk of human error is removed. The information is stored in a database for easy analysis. Accurate and timely information can be reviewed such as machine productivity, waste and spoilage, job tracking, quality information, downtime, uptime, station and operator log in times. Available separately or as a package, both technologies offer significant production advantages.

Enhanced with
SecureSCAN™
Technology
