

Secure Fail-Safe Control

SureSCAN™

Standard on all **Leary Array™** controllers, **SecureSCAN** technology has been developed by **Leary** to provide fail-safe product monitoring, tracking and quality assurance. **SecureSCAN** delivers high-speed automatic product security combined with powerful productivity tools designed to help maximize efficiency and minimize production line stoppages.

SureSCAN works by accounting for every single product as it enters, travels through and leaves the production line. At any point in time, **SureSCAN** knows the exact location of every product, the product dimensions, rate of speed, which quality stations have scanned the product and how many others are due to scan it before it leaves the line, so that every product receives 100% inspection.

SureSCAN is also responsible for the safe removal of non-conforming products. Should a quality sensor identify a product as nonconforming, **SureSCAN** tracks the product to the rejection station and removes it without interrupting production. A fail-safe sensor is used to ensure the ejection actually took place.
